## Feeding/Mixing Instructions

### 1. Quantity to be prepared

- Be sure to read instructions on the bag or tag as different products sometimes have different sized cups and different species require different mixtures.
- Fill plastic cup with milk replacer (milk replacer density can vary, periodically check the quantity the cup holds).
- Put required quantity of clean warm water at 110°F to 115°F in a clean bucket.

### 2. Mixing

- Always use warm water.
- Sprinkle milk replacer from the plastic cup onto the surface of the warm water.
- If powder is just dumped from cup onto the water surface, large balls may sink to the bottom of bucket.
- Use a wire whisk that can reach the bottom of the bucket to agitate powder and water to form a complete solution.
- If using milk mixing machine, do not over mix by running the machine too long.

### 3. Feeding

- Follow feeding directions supplied with product.
- Only mix enough milk replacer for the current feeding.

### 4. Caution

- It is not advisable to mix milk replacer and water in a nipple bottle. It is preferable to prepare solution and pour mixed milk into nipple bottle.
- Don't use a stick or similar instrument to mix milk replacer. Some agitation is needed, which can best be achieved with a wire whisk.
- Don't add water to powder. It makes mixing more difficult.
- Sanitation is important. Clean all utensils after each feeding.
- To keep the milk replacer powder fresh, tightly roll the bag closed and store in a cool, dry place.
